

GENEVA POLO SOCIAL CLUB

Where We Go From Here

DELIVERY ROADMAP

August 2026

About This Document

This document sets out the work proposed across the engagement: twelve areas of activity, what each comprises, and the reasoning that earns it a place.

It is a working plan rather than a schedule. It fixes neither dates nor acceptance conditions, which run through the monthly report under Clause 2.3 of the Services Agreement. The order of work proposed towards the end is a recommendation, and the reasoning behind it is set out so that it can be disputed.

Beneath the twelve areas lies work that never appears on a screen: holding the software the platform depends upon current, and moving the club's hosting into an account the club owns and pays for directly. It is the work that keeps a difficulty with member data from ever reaching the association.

The Twelve Areas

- | | |
|----|---|
| 1 | Event finance reconciliation |
| 2 | Media management platform |
| 3 | Event distribution and external ticketing |
| 4 | Conversion optimisation |
| 5 | Comms strategy |
| 6 | Consolidate leads and contacts |
| 7 | Discount codes |
| 8 | Corporate membership growth |
| 9 | Phone: identity, login and the WhatsApp channel |
| 10 | Contacts and systems architecture |
| 11 | Orchestration into introductions |
| 12 | Member portal engagement |

Already in Place

The platform running today was built before the engagement's effective date. The fee does not reflect it, and it continues to earn its keep.

EVENTS AND TICKETING

Events with several ticket types and rates. Booking with card payment. A waiting list that can offer paid places when seats free up. Extra places and upgrades added to an existing booking. Cancellations, guest lists and complimentary places.

AT THE DOOR

Ticket scanning and bracelet access. A check-in screen with a live arrivals list. Guests naming their own places, household tickets, and the waiver signed at entry. A printable list for doors checked by hand.

MEMBERSHIP

Applications through review, approval and decline. A member area with dashboard, profile, events, digital card and regulations. Renewals, honorary renewals, and the return of lapsed members. Membership levels. Referral credit. Public card verification.

MONEY

Card payment for both events and membership. Payment retry links. Refunds issued by an administrator. A finance view covering membership and per-event income, with refunds deducted.

COMMUNICATION

Every transactional message on managed templates. Broadcasts with drafts, audience preview and send. Messaging for a single event. Five automatic reminder streams.

ADMINISTRATION

An administration area with role-based access. Scheduled tasks with a screen to inspect and run them. Template editing. Lounge sessions. Mobile-ready throughout.

The Work

Twelve areas, what each contains, and the argument for it.

1. *Event Finance Reconciliation*

Every franc that moves is traceable to the booking that caused it, and every booking that claims money names the payment that carried it. A per-event profit and loss sits downstream of that, and is worth little without it.

WHAT IT CONTAINS

- **Payment attribution.** Every record that moved money names the payment that moved it — bookings, added places, upgrades, refunds. This is the foundation; the remainder is reporting.
- **Extra places.** When a guest adds places themselves, the platform charges, issues and records in one motion. When an administrator adds them, the seats move but the money does not — so the places are given away without anyone deciding to. Both paths onto one record.
- **Refund reconciliation.** Refunds are issued from the roster with nothing confirming they settled, so a refund that fails leaves the club reporting a figure that never happened. Reconcile issued against settled, and surface cancellations that freed a seat but never returned the money.
- **A check in both directions.** Every payment received maps to a booking, and every booking claiming income maps to a payment. One direction catches money the club holds and cannot attribute; the other catches income reported but never collected.
- **Complimentary places recorded as such,** so a booking made by hand is distinguishable from a purchase that lost its payment record. At present the two look identical.
- **Externally sold tickets** reconciled into the same per-event picture. Income covering only what the platform sold is not the event's income.
- **A ledger for every event.** Beneath each event, a line-by-line record: each booking, and within it the original payment, places added later, upgrades and refunds.
- **A leaderboard of the club's largest supporters,** ranking contacts by what they have spent across tickets and membership together, by season and lifetime.
- **Per-event profit and loss, and committee reporting,** per event and per season — once the points above make the underlying figures trustworthy.
- Deposit handling, and payments authorised now but taken later.

Why this matters: a committee cannot defend a figure it had to assemble by hand, and a season is difficult to close when income arrives by routes the records treat differently.

The finance area already opens membership income down to its individual payments, and referral credit down to the transactions beneath it. Event income alone has nothing underneath — though the detail exists, since it can be exported to a spreadsheet. It is withheld from the screen rather than absent from the system.

The leaderboard answers a question the club currently cannot: who to invite, who to approach about corporate membership, and whom the club would most miss. A rough version is already computable — the leading contact has spent CHF 2,960 across two bookings and a membership. Three things must be settled before the figure can be trusted: that one person is recognised across their several email addresses, that a lead booking a table of twelve is not simply recorded as the spender, and that refunds are deducted.

Note: discount codes and corporate billing open this same payment path. Build the three together rather than opening it three times.

2. Media Management Platform

An image and video library for the club, holding photography and match footage, hosted by the club itself. Commissioned photographers and videographers deposit their work directly into it.

WHAT IT CONTAINS

- A central library for photography and footage, replacing material held on personal phones.
- Background backup from committee and photographer phones, so footage arrives without anyone remembering to send it.
- Tagging, albums, and search by what an image actually shows.
- Face recognition, for finding a member across a season.
- An album per event.
- A durable archive that survives committee turnover.

Why this matters: the club's visual record is dispersed across personal phones, SharePoint and individual hard drives. Recovering a particular photograph or clip means asking several people and trusting that one of them has kept it; anything held on a personal device departs with its owner. Video fares worst, the files being large enough that they are seldom shared at all.

The saving falls in two places. **In operation**, photographers and videographers deposit work directly rather than sending files to be gathered, renamed and filed by hand. **In preparation**, whoever is assembling a post, a newsletter or a sponsor pack searches one place, instead of spending an afternoon in pursuit of an image.

WHAT IT DOES NOT DO, AND NEEDS A DECISION

The chosen platform is a photo manager rather than a rights system. It does not record who shot an image, what it may be used for, or whether the subject consented; it has no approval step before publication. The club publishes photographs of identifiable members, sponsors and children, so this is a governance question rather than a feature preference – see decision 1.

Running costs sit with the client under Clause 2.5: server, storage and processing. Video is what drives the figure, and it is better named before deployment than after the first invoice.

3. Event Distribution and External Ticketing

One event record, published outward to channels that list it and to channels that sell it. Two different depths of work, and worth separating when estimating.

CHANNELS THAT LIST

- One publish action driving every channel: Eventfrog, Genève Tourisme, the club's Facebook and LinkedIn pages.
- English translations of event copy, required before Genève Tourisme will carry a listing.
- Listings link back to the club's own page. Ticketing stays there, so the club keeps both the guest's details and the payment relationship.

CHANNELS THAT SELL

- Guest lists drawn in automatically from each channel.
- **A door credential issued for every externally sold ticket**, ahead of the event, so the existing door and roster work unchanged. Without it, a guest arrives holding a ticket the door cannot read.
- The waiver captured from those guests on the same terms as anyone else.
- Money collected elsewhere reconciled into that event's accounts.
- Every guest list consolidated into the club's contact records.

Why this matters: listing is straightforward. Selling elsewhere is not, and it is by some distance the more consequential half. A guest who buys on another platform must still arrive holding something the door can read; the money must still reconcile into that event's accounts; and their details must still reach the club's own records. All three are the club's responsibility rather than the channel's.

Handled well, an outside channel becomes a source of members. Handled poorly, the club pays a commission for the privilege of losing all three.

The consideration is sharpest for COPA SAN MARTÍN, the largest gathering of the year and the one ticketed outside the platform. Its guests do reach the club's records today – but by hand, at roughly an hour of someone's time for each event, with the income reconciled separately afterwards. An import returns that hour and removes the transcription errors any retyped list carries.

From the club: organiser accounts for each channel. **Depends on** area 10 for the record-ownership and credential decisions.

4. Conversion Optimisation

Measuring the passage from guest to member, and the booking that precedes it – then improving whichever step loses the most people.

WHAT IT CONTAINS

- **Guest-to-member conversion, measured.** The proportion of those who attend who go on to join. It is the club's stated scoreboard and nothing computes it today.
- **The booking steps defined and instrumented.** Analytics are already installed and recording visits and errors, but nothing marks a step in the booking itself – seeing an event, beginning a registration, paying, confirming. Until those exist there is no view of where a guest falls away.
- Removing friction at checkout, directed by what the measurements disclose.
- Testing the event page: wording, imagery, how price is presented.
- Attribution by channel, so distribution effort can be judged rather than assumed.

Why this matters: the guest-to-member proportion is the claim upon which the whole approach rests, and it cannot be produced today without being assembled by hand — the club is investing in a conversion it cannot yet observe.

What that assembly currently yields is instructive. Across all event data, three people appear as guests before their membership exists; thirty others attended events they came to as members already. The reporting cannot presently distinguish the two.

Nor can anyone see where a prospective guest abandons a booking, so adjustments to pricing or wording are conjecture and their effect cannot be judged afterwards.

Sequencing: measure before area 3 goes live — publishing without measurement produces visitors nobody can appraise. **Depends on** area 6: both figures rest on recognising the same person across events.

5. *Comms Strategy*

What the club sends, to whom, and which of it should run without anyone remembering. A strategy exercise first and a build second.

WHAT ALREADY RUNS UNATTENDED

Event reminders, hourly. Renewal reminders, payment reminders, committee reminders and membership expiry, daily. Every transactional message — tickets, receipts, confirmations, waiting-list offers, household tickets, cancellations — as it is needed. Broadcasts composed by hand, with drafts and audience preview.

WHAT IT CONTAINS

- The strategy itself: what is sent, to which group, upon what occasion, and what is deliberately not sent.
- **Follow-up after an event**, to those who attended and are not members.
- Segmented email against the contact records from area 6.
- Broadcast over WhatsApp: one to many, on a channel members cannot post into.
- A review of the six existing automations for timing, overlap and tone.

Why this matters: every lifecycle moment in the platform is already automated but one, and it is the one that converts: **nothing is sent after a guest attends**. The crowd is captured at the door and then nothing reaches them. That is the moment at which someone who has just enjoyed an evening is likeliest to join, and it is the single moment at which the club says nothing.

The existing community groups are unmoderated and thick with automated accounts. A channel the club controls supersedes them.

From the club: a business WhatsApp account, a dedicated number, and the Meta business connection. **Depends on** area 6 for a clean list, and area 9 for the numbers to send to.

6. Consolidate Leads and Contacts

The contact system, built and populated — every contact the club already holds, and every one it meets from here. This is the closest match in the roadmap to Clause 2.2(a).

WHAT IT CONTAINS

- Migration of existing contacts from every place they currently sit.
- Deduplication and cleaning.
- Segmentation: member, prospect, corporate, sponsor, press.
- Points of capture designed around how the club actually meets people — at events, on the field, through introductions.
- Lifecycle stages, and the corporate pipeline that extends into area 8.
- **Every point of capture writing to the contact record as its primary act**, not as a copy taken afterwards: booking, ticket claim, door check-in, waiting list, membership application, and externally ticketed events by import. A capture point that does not write to the contact system is a leak, and at present every one of them is.
- **One rule for telling people apart.** An email address belongs to the buyer, not to the booking; a guest on someone else's booking is a contact in their own right, with no address until they give one. The real work is recognising one person who appears twice across sources — a nameless attendee last season and a buyer this one.
- **Consent held per contact and per channel**, with the evidence — the wording shown, and when — kept at the point where it was given.
- An enumeration of every system holding club contacts, with a date on it. An unknown source discovered mid-migration is what breaks a migration.

Why this matters: 633 people have registered, bought a ticket or joined a waiting list. 590 of them are not members. They are held in four separate places, with nothing that treats them as one person, and no record of a contact exists anywhere as such.

Nor is the difficulty merely historical. 129 of 542 tickets carry no email address whatever, and 32 of those people walked through the door. They were met in person and cannot be reached — no message the club sends will ever arrive, and no migration will recover them. Directing every point of capture at a single record is what prevents the recurrence.

Follows area 10, which settles record ownership and the identity rule. **Prerequisite to** areas 5, 4 and 8, and it feeds area 11.

7. *Discount Codes*

WHAT IT CONTAINS

- Generating and managing codes.
- Discounts by percentage or by fixed amount.
- Codes by membership level, and codes for sponsors.
- Limits on use, expiry dates, and restriction to a single event.
- Reporting on what was redeemed, feeding back into area 1.

Why this matters: it allows the club to be generous deliberately, and to see what that generosity secured. Built alongside the finance work, both opening the same payment path.

From the club: the discount policy — who qualifies, how deep, and whether offers combine.

8. *Corporate Membership Growth*

Driving more corporate memberships. Led by selling rather than by building — but the selling is supported by the platform, not merely recorded by it.

THE EFFORT

- A target list of companies, and the pitch — owned by sales rather than by engineering.
- Outreach, and the conversation about price.
- Corporate hospitality sold against event capacity, once area 1 makes event income and capacity trustworthy enough to sell against.

WHAT THE PLATFORM CONTRIBUTES TO THE SELLING

Built before a first agreement rather than after it, because these are what make the effort land.

- **A route for a company to come in.** A corporate enquiry and signup path distinct from the individual one. At present a company interested in membership has nowhere to arrive but a form written for a single person.
- **Corporate benefits presented properly** — what such a membership actually includes, set out so it can be read and compared rather than described in a paragraph.
- **Lead targeting.** Drawing the account list out of the club's own data rather than assembling it by hand: which companies are already represented, by how many members, and at what seniority.

- **Support for whoever runs the effort** — a view of the pipeline showing who has been approached, where each account stands, and what was agreed.
- **Measurement of the corporate path** — enquiry, conversation, agreement — so the effort can be judged and improved rather than repeated blind.

WHAT FOLLOWS A FIRST AGREEMENT

- A company account holding places for named individuals.
- Billing at account level, and changes to places within the term.
- Individuals joining and leaving independently of the account.

Why this matters: a corporate member brings several people and a longer commitment than an individual one. 87 of the club's 165 members already name a company — an opening list of organisations already acquainted with the club rather than a cold one, and one the contact records can surface rather than someone assembling it by hand.

The account machinery is deliberately held until a company has agreed to join, since it is straightforward and there is little sense in building it in advance of demand. The work that comes first is the work that helps win the agreement: somewhere for a company to arrive, a clear account of what it receives, a prioritised list of whom to approach, and sight of how the effort is progressing.

Depends on area 6 for the target list and the pipeline view, area 4 for measuring the corporate path, area 12 for the benefits surface, and area 11 to turn a list into conversations. **From the club:** who owns the effort, and the terms a first agreement needs — decisions 7 and 8.

9. Phone: Identity, Login and the WhatsApp Channel

Not merely a matter of data quality. One well-formed number per person is what portal sign-in, WhatsApp broadcast, and every point of capture all rest upon — the same number serving three purposes, and so needing to be put right only once.

WHAT IT CONTAINS

- Numbers validated and stored in one international format wherever they are entered.
- Capture at every surface: booking, ticket claim, the door, membership application.
- Consolidation onto the contact record, so a number given at a door reaches the person's record rather than remaining on a ticket.
- The number as a secondary signal for telling people apart in area 6 — never as the sole one.
- **Sign-in by telephone**, alongside or instead of email.
- **WhatsApp broadcast**, which requires a verified number for each recipient. The broadcast itself belongs to area 5; this is what makes sending possible.

Why this matters: signing in by telephone removes the password from the commonest route by which members reach the platform, and it is what makes broadcast over WhatsApp possible at all.

The work is nearer than it appears. 132 of 165 members already have a number on file and all but eight are already well formed; a further 288 tickets and 226 bookings hold numbers stranded where no member record can see them. Sign-in by text message is already built and awaiting only the club's account details. This is a short undertaking, not a campaign to gather numbers.

Sequencing: the data work belongs with area 6, since telling people apart needs the tidy field. Sign-in need not wait for the broadcast work and could come earlier if wanted.

10. Contacts and Systems Architecture

The written agreement for how people move between systems. Short, and it releases three of the larger areas.

WHAT IT CONTAINS

- **Which system owns which fact**, rather than which system owns the person. The contact system owns the relationship — stage, segment, owner, notes. The platform owns attendance, payment and the evidence of consent, being the only one with a door, a card and a payment record. A tool that merely stores addresses is not thereby a source of truth.
- **Which way information travels** — one direction per fact, from its owner outward. Two systems both accepting changes to the same fact fail by drifting apart quietly rather than by reporting an error.
- **One rule for telling people apart**, applied by every connection rather than reinvented for each.
- **What permission the club holds**, per source.
- The credential path for externally sold tickets, feeding area 3.
- **A named person responsible for each system** — organisational rather than technical, and what keeps the first point true six months later.

Why this matters: answered once, these questions are inexpensive. Answered three times over, differently, by three separate pieces of work, they become a data clean-up.

The question of permission carries the risk. An address given on a booking form, one imported from an old mailing list, and one obtained from a ticketing platform do not carry the same permission to send. Merged into a single list and broadcast to, that distinction disappears — and under Swiss and European data protection law the association is accountable for it.

11. *Orchestration into Introductions*

Clause 2.2(c): turning contacts into introductions and opportunities. Distinct from building the contact system — this is operating it.

WHAT IT CONTAINS

- The signals worth acting upon: who attended what, who has been introduced to whom, and what has gone quiet.
- A prompt to the right person at the right moment, rather than a report nobody opens.
- Introductions tracked: made, accepted, and what came of them.
- Feeding the private assistant, which is where this becomes leverage rather than administration.

Why this matters: building the contact system and operating it are distinct undertakings. The first yields an orderly record; only the second yields introductions and opportunities. It is likewise the mechanism beneath corporate growth in area 8 — a target list becomes revenue through conversation, not through software.

12. *Member Portal Engagement*

The between-events reason to sign in. Conversion does not hold if there is nothing behind the door.

WHERE IT STANDS TODAY

The member area is largely passive: a welcome, membership status and level, the next four events, a digital card, and a fixed weekly lounge schedule with no means of booking. What a membership is worth is a paragraph of text shown once at joining, rather than anything a member can browse. The single section aimed at ongoing engagement is a link out to the club's WhatsApp group — the same group area 5 proposes to supersede.

WHAT IT CONTAINS

- **Member benefits made real** — a directory a member can browse, rather than a paragraph describing one.
- **Something in the portal worth opening between events**, so its own engagement surface stops directing members elsewhere.
- **Event recaps and photography**, drawing on area 2's library.
- **Lounge booking**, turning the fixed schedule into an actual reservation.
- **A member directory**, by choice rather than by default — and a source for the introductions in area 11.

Why this matters: a membership worth something only on event days is a membership that lapses. At present the platform's answer to "why return" directs members away from the platform.

Depends on area 2 for recaps, area 6 for the member data a directory needs, and area 11 for introductions once a directory exists.

Order of Work

A recommendation, and the reasoning that produced it.

- FIRST** **Housekeeping.** Bring the software the platform depends upon up to date. Small, unglamorous, and it grows only if neglected.
- THEN** **Agree how the systems fit together** (area 10). A short written decision rather than a build. Three of the larger areas wait upon it, and each becomes cheaper for having it.
- THEN** **Money** (areas 1 and 7), which share a payment path and are therefore built together rather than opened twice.
- THEN** **One record per person** (area 6, with the phone work inside it). The COPA SAN MARTÍN guest list belongs here too — ahead of the event, not after it.
- THEN** **Communication** (area 5), once the contact list is sound. A broadcast against a poor list is worse than no broadcast at all. Post-event follow-up is the first thing to build.
- THEN** **Reach** — measurement first, then publication to outside channels, then improvement of what the measurements disclose. Publishing without measurement produces visitors nobody can appraise.
- THEN** **Introductions** (area 11), once there is a populated contact record to work from.
- THEN** **Photography** (area 2), followed by **the member area** (area 12), which draws on it for recaps. Two parts of area 12 — member benefits and lounge booking — depend on neither and could come forward if the club wants that value sooner.

Corporate growth (area 8) is a selling effort and proceeds alongside all of this rather than waiting for a place in the sequence. Its platform work joins the money phase once a first agreement is close.

Also in the Engagement

A Private Assistant

Clause 2.2(b): a private assistant on a dedicated secure server, established and tuned across the term, connected to the contact records and the pipeline as they take shape. It is the most personally useful thing the engagement produces, and it belongs early — alongside the contact work rather than following it.

Coaching

Clause 2.1: two sessions a month, CHF 500 monthly across the year. The value lies in holding the slot. An unused session converts to a written brief or a recording, or carries over into build work at the same value — it is not forfeited, though it is easily undercounted precisely because nothing is built.

What We Need From You

Decisions that shape the work. Several release more than one area.

- 1 Photography, permission and consent.** Handle it through club process, add a light consent record to the photo library, or pair it with a system built for rights. This decides how much the photography work costs.
- 2 Where the photo library runs, and the storage budget for video.** Video is what drives the cost. Under Clause 2.5 running costs sit with the client, so the figure is better named before it appears on an invoice.
- 3 Discount policy.** Who qualifies, how deep, and whether offers can be combined.
- 4 Phone numbers already on file.** Whether a number given when booking a ticket may be added to that person's member record without asking them again, and what the club says at the point of capture.
- 5 The private assistant** named in Clause 2.2(b): where it runs, and what it is allowed to see.
- 6 Whether OTM and the Geneva Polo Club association are treated as one party or two** for this engagement.
- 7 Who owns corporate membership growth** — a dedicated sales role, or existing committee capacity carrying it alongside everything else. It is the difference between an effort and an intention.
- 8 Corporate terms,** once a first conversation is close: how many places per level, what a place costs, who may reassign one, and what happens to those people if the company does not renew.
- 9 COPA SAN MARTÍN guest details.** Whether the ticketing provider will release them, in what form, and on what basis the club may then contact those people.
- 10 The existing mailing list.** It stops being a second source of truth either way. Whether it remains the tool the club sends from is a separate question — the platform can already do it, but the existing tool is easier for a non-technical hand to compose in. Worth settling who actually writes the newsletters before choosing.
- 11 Consent wording at each point of contact:** who drafts it, who approves it, and whether it differs by channel.
